

## Ecosystem

### Git-converted Projects

- Apache (select project only, read-only mode)
- 1.3 million projects at GitHub
- Android
- Perl
- Grails
- Hibernate

## Scalability

- Linux kernel averaging 2–4 changes per hour continuously for the last 4 years
- Have used with repos up to 2.4 GB in size, but that's on the large size
- `git gc` on an 8GB project is quite slow
- Modularization of your project is key (submodules)
- A multi-GB file can cause Git to run out of memory while committing it.
