# Setting up Git

### Get binaries

#### On UNIX

- Compiling from Source
  - Web UI to browse source
  - Git repo for source: git://git.kernel.org/pub/scm/git/git.git
  - Zipped source packages: http://kernel.org/pub/software/scm/git/
  - Run make
  - Then run make install
- Binaries from a Package manager

```
- apt-get git-core
```

- apt-get git-gui
- apt-get git-doc
- apt-get git-svn

### On Mac

- MacPorts (user-compiled)
- HomeBrew (user-compiled)
- git-osx-installer (precompiled)

#### On Windows

- Two msysGit choices: a full toolkit, or just a precompiled distribution.
- Precompiled is named "Git-XXXexe"
- Full toolkit with gcc compiler is named "msysGit-fullinstall-XXX.exe"

If you get stuck, a series of help pages at GitHub are almost certain to assist.

## Configuring your Git username and email address

Establish the one-time parameters stored in your home directory:

```
git config --global user.name "Your Name"
git config --global user.email "you@example.com"
git config --global color.ui "auto"
```

View our handiwork

echo ~/.gitconfig
