# Setting up Git

## Get binaries

#### On UNIX:

- From source
  - Web UI to browse source
  - Git repo for source: git://git.kernel.org/pub/scm/git/git.git
- Package manager

```
apt-get git-coreapt-get git-guiapt-get git-docapt-get git-svn
```

#### On Mac:

- MacPorts (user-compiled)
- HomeBrew (user-compiled)
- git-osx-installer (precompiled)

#### On Windows:

- Two msysGit choices: a full toolkit, or just a precompiled distribution.
- Precompiled is named "Git-XXXexe"
- Full toolkit with gcc compiler is named "msysGit-fullinstall-XXX.exe"

If you get stuck, a series of help pages at GitHub are almost certain to assist.

### Configuring your Git username and email address

Establish the one-time parameters stored in your home directory:

```
git config --global user.name "Your Name"
git config --global user.email "you@example.com"
git config --global color.ui "auto"

View our handiwork
echo ~/.gitconfig
```
